

The Original **CowBuddy**[®] Fly Control System

Simple

One pint of liquid insecticide is poured into the steel channel to be absorbed by the ropes. The liquid is transferred to the coat of the animal as contact is made with the ropes.

Durable

The frame is made from heavy structural steel, MIG welded, and coated with rust-resistant paint for many years of service. Galvanized steel sleeves are crimped onto the high quality derby ropes.

Effective

After more than a year with the same insecticide, the CowBuddy[®] continues to provide dramatic results.

Don't let your profit "fly" away.

Can you afford to let the flies have \$25 to \$40 per head in weight loss and/or feed conversion?
